

It's too dry here for heartworms.

Grounded or **Unfounded?**

FACT: Heartworm disease has been diagnosed in states with dry climates, such as Arizona or Nevada. Micro-climates resulting from irrigation, backyard ponds, golf courses, and other sources also affect how severe and how long the mosquito season lasts in dry areas.

Although heartworm disease is seen less frequently in the arid states, it IS present, and your pet's risk may vary even within the state itself.

BEST STRATEGY: A routine 12-month prevention program regardless of predominantly dry weather patterns.

Protection is priceless.

Choose year-round heartworm prevention for your pet.
